

THE SYM-1 USERS' GROUP NEWSLETTER

VOLUME II, NUMBER 3 (ISSUE NO. 9) - AUTUMN 1981 (JUL/AUG/SEP)

SYM-PHYSIS is a quarterly publication of the SYM-1 Users' Group, P. O. Box 315, Chico, CA 95927. SYM-PHYSIS and the SYM-1 Users' Group (SUG) are in no way associated with Synertek Systems Corporation (SSC), and SSC has no responsibility for the contents of SYM-PHYSIS. SYM is a registered trademark of SSC. SYM-PHYSIS, from the Greek, means the state of growing together, to make grow, to bring forth.

We welcome for publication all articles dealing with any aspect of the SYM-1, and its very close relatives. Authors retain all commercial copyrights. Portions of SYM-PHYSIS may be reproduced by clubs and educational institutions, and adaptations of programs for other computers may be freely published, with full credit given and complimentary copies provided to SYM-PHYSIS and the original author(s). Please include a self-addressed stamped envelope with all correspondence.

Editor/Publisher: Business/Circulation: Associate Editors: H. R. "Lux" Luxenberg Jean Luxenberg Dennis Hall, Jack Brown Jack Giervic

SUBSCRIPTION RATES (1981)

USA/Canada - \$10.00 for a volume of four issues. Elsewhere - \$13.50. Make checks payable in US dollars to "SYM-1 Users' Group", P. O. Box 315, Chico, CA 95927, Telephone (916) 895-8751

Issue #0, the Introductory Issue (1979), and Issues 1 through 6 (1980), are available, as a package, for \$12.00, US/Canada, and \$16.00, First Class/Airmail, elsewhere.

RAE'S SUG-GESTIONS

We have had little success in thinking of a clever title for the introductory editorial material which appears in this position in each issue. It dawned on us, as we were assembling and editing the material for this issue, that we were serving as the Resident Assembler Editor (RAE) for the SYM USER'S GROUP (SUG); hence the above caption. Surely some reader can provide a better heading (but certainly never a worse pun!)?

We seem to be following the, by now traditional, custom of user group newsletters in being late with each issue. We'll skip the apologies and excuses, to save space and time for all, and proceed to the facts:

The emphasis in this issue is on printers and RAE-1. As you must know by now, cost/effectiveness is one of the most important factors affecting our buy/no-buy decisions. In every-day words, we want to spend as little as possible on the necessities (but can easily be persuaded to pay much more for luxuries!). We first determine our minimal requirements, then decide whether additional capabilities justify their added cost.

Take printers, for example. Our minimal requirements are for a "good-looking", easily readable page (this implies lower case descenders to us). Also, we don't try to hide the fact that our correspondence is prepared on a computer; after all, computers are our way-of-life. Thus, if a dot matrix printer meets our minimal requirements, it would not be worth an additional \$1000 to us to pay for so-called "typographic quality". We might pay \$100, or \$200, but \$500 more would take a lot more soul-searching!

As of Summer '81, we consider the Epson MX-80 to be the "best buy" in

printers. We will be incorporating it in our OEM (SYM-based) word processing systems. IBM is following our lead in this instance, by also providing the MX-80 (under their own label) as part of their newly announced (8086-based) personal computer system! According to the trade journals, the MX-80 is now the "best-seller" among printers, selling like Apples!

Here are some printing "samples" from our MX-80:

FONTS

Compressed, Standard, Expanded-Compressed, Expanded Compressed, Standard, Expanded-Compressed, Expanded

MODES

Normal, Double-Strike, Emphasized, Emphasized-Double

The emphasized-double-strike mode compares very favorably with a conventional typewriter with cloth ribbon, but the printing rate is reduced from the normal 80 cps to a mere 20 cps. All of the eight type fonts (the italics come only with GRAFTRAX-80) shown above can be printed in the normal and/or double-strike modes, but only the standard and expanded fonts can be printed in the two emphasized modes.

LOOK AT THIS!

The MX-80 also has underlining capability, based on its ability to generate any desired inter-line spacing. One of our planned near-future tasks is to prepare a version of SWP which can take full advantage of this, and other features of the MX-80. These include fully selectable horizontal and vertical tabbing. Text and graphics can be intermixed, as well. Look for demonstrations of this in future issues, as we grow in our understanding of this marvelous new tool!

RAE-1 is one of three features which make the SYM-1 an outstanding performer in any price class (the other two features are SUPERMON and the versatile I/O capabilities). In this issue are several support programs for RAE (including an Epson MX-BØ interface) and the announcement of several add-on programs, including a Cross Reference Lister and a Structured Programming Enhancement Package. These two add-ons, plus SWP-1, and Hissink's Disassembler into RAE, make RAE-1 an even more versatile software package.

And now, on with the news.....

ON PRINTERS

Our first "printer" was a Teletype KSR-35 (the "heavy-duty" model of the KSR-33), working at a slow, noisy, oily-smelling, 110 baud, upper case only. This was replaced by a decwriter II (LA-36), when we were offered one at a price too low to refuse (still over \$1000, though). We were thrilled by the lower case, and the 300 baud, which we almost immediately upped to 600 baud by a very simple modification. No "hand-shaking" required at this rate, either!

The LA-36 is a truly remarkable, thoroughly reliable, piece of equipment, and has needed no maintenance, preventive or otherwise, in over two years. Our only troubles were self-induced, when twice we used cheap ribbons, the lint from which clogged one of the print wires so that it would not retract. The problem was easily solved with a few squirts of TV Contact Cleaner.

We had only three objections to the LA-36. First was its lack of portability. It was a back-breaking task to get it loaded into the

trunk of our car (the lid wouldn't close either) for a demonstration. Second was the lack of descenders on the g, j, p, q, and y. The g was the worst appearing of the letters, and one had to look carefully to distinguish between the g and the s in such words as sag, gag, gas, gabs, etc. Third, like the 8" disk drives, its motor runs all of the time it is powered-on, and we find the noise objectionable.

As you can see, we now have a new printer. We chose the Epson MX-80, which answers all three objections, at much less cost, and with far greater versatility. We have the FT model, in case we ever wish to feed single sheets of letterhead, or envelopes, and have added the GRAFTRAX-80 EPROMS, 3 2716s, in place of the original 2332 ROM, to give us italics and high resolution bit graphics (to go with the MTU Visible Memory). We are now on the parallel interface, but will switch to the current loop, via the serial interface card, to free up the VIA for other purposes.

We are only just now learning to use some its features, most of which are invoked with ESC sequences and CONTROL codes. RAE-1 users are aware that RAE does not emit most of the CONTROL codes; instead, RAE prints them as "up-arrows" followed by the corresponding alpha (SWP-1 won't print up-arrows, incidentally). Thus RAE's output must be monitored for "up-arrows", and when one is encountered in the output stream, if RAE is emiting it because it has encountered a control code, the actual control code itself must be sent to the printer.

Also, the ESC sequences are not "visible" on the terminal and two very important Epson sequences, ESC E and ESC G affect the KTM-2 by clearing the screen and setting its graphics mode. The former is disconcerting, since the number of the line which contains it is unseeable, but the latter may be nullified with an ESC g. It is therefore desirable to inhibit any ESC sequence from reaching the terminal, and substituting in its place a "token", such as, for example, the "\$". The printer patch published below "protects" the KTM-2 from all ESC sequences and CONTROL codes, but "displays" them with "\$" and "up-arrow" prefixes for editing.

DATA 4	5	B -AA	2PB3
DATA 5	6	AA- J	2PB4
DATA 6	7	AA- 7	2PB5
DATA 7	8	AA- H	2PB6
DATA 8	9		
STROBE	1	AA- 5	2CB2
BUSY	11	AA~ 6	2PB7
LOGIC GRND	16	AA- 1	GRND

Remarks: Only 10 wires go between SYM and Epson. Tie DATA 8 to ground at Epson connector. All return lines (19 thru 30) are tied to ground at the Epson.

ALTERNATIVE WIRING LIST

You may wish to use the A Port instead, reserving the B Port for applications requiring its Darlington drive capability, or the special purpose functions available through PB6 and PB7. We will be making this switch ourselves. We had planned to use the 20 mA current loop for the printer, but instead will be converting that to inverted TTL (RS-232C compatible) for use with a modem. Here is the PORT A Wiring List:

EPSON NAME	EPSON PIN	SYM PIN	SYM NAME
DATA 1	2	AA- D	2PAØ
DATA 2	3	AA- 3	2PA1
DATA 3	4	AA- C	2PA2
DATA 4	5	AA-12	2PA3
DATA 5	6	AA- N	2PA4
DATA 6	7	AA-11	2PA5
DATA 7	8	AA- M	2PA6
DATA 8	9		
STROBE	1	AA- 4	2CA2
BUSY	1 i	AA-1Ø	2PA7
LOGIC GRND	16	AA- 1	GRND

A convenience feature you will wish to add (based on an idea of Jeff Holtzman's) is an "IGNORE BUSY" switch. This will permit you to put the printer OFF LINE while you are entering data at the terminal which you do not wish printed. The switch will then permit terminal entry while the printer is switched off-line. The simplest method of implementing such a function is to switch in a pull-down resistor from the BUSY input to GRND. A suitable value is around 1K. This will also permit a quick "preview" on the terminal before the final printing.

REMARKS

ESC G sets graphics mode on KTM-2; cancel with ESC g ESC E clears screen on KTM-2; no way to cancel! Except for CONT Q, CONT S, ESC sequences suffice for all purposes

The TRS-80 graphics set "replaces" the ASCII values from \$A0 through \$DF with the 64 "symbols" made up by blacking in all possible combinations of squares within a two (horizontal) by three (vertical) rectangle. When operating in the condensed character mode, the TRS-80 graphics set provides 264 "pixels" across an 8 inch paper. Following are examples of the TRS-80 graphics font:

Standard Alphanumeric ! "#\$%%' () *+, -./Ø123456789:;<=>/@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_ Standard TRS-8Ø Graphics

Note that the "up arrow", "^", which is not printable with SWP-1, actually appears above, together with its corresponding TRS-BØ graphics symbol. SWP-1 uses the "^" as a "symbolic space" to signal the justification subroutine not to "adjust" the spaces so indicated. The "c" is printed as a space (\$20). We have frequently felt the need to print the "^", as in the example. We therefore have modified our SWP to substitute a character for the "symbolic space" for which we can see absolutely no use whatsoever! This is the character whose ASCII code is \$60. This shows up on the KTM-2 screen as a "sigma", and on the printer as a "little hook". It is entered on the KTM-2 by holding the shift key down while hitting the "return" key; this is no more complicated than entering the "^".

INTER-SYM COMMUNICATIONS ____

The fastest, and perhaps simplest, method of interchanging files between two closely adjacent SYMs is via the cassette interface. First connect their grounds together, then connect the "left"-end of R90 on the "talking" SYM to the "right"-end of R92 on the "listening" SYM. Then enter L2 <cr>, and S2 ID.SA.EA <cr> on the proper SYMs.

We made up an eight foot long flexible three-wire cable to enable us to interconnect any two of our SYMs. The three wires were once part of a 25-wire flat ribbon cable, and micro-probe connectors are used to permit rapid changes.

To speed up the interchange by a factor of more than 6%, try the following (Only HSBDRY need be changed at the receiver, and only the others at the sender):

- 1) Change \$A630 from \$04 to \$01 to shorten the synch signal time from approximately 4 sec to approximately 1 sec.
- 2) Change \$A632 from \$46 to \$ØC to shorten HSBDRY from $7Ø \times 8 = 56Ø$ usec to $12 \times 8 = 96$ usec.
- 3) Change \$A635 from \$33 to \$08 to shorten TAPET1 from 51 x 5 = 255 usec to 8 x 5 = 40 usec.
- 4) Change \$A63C from \$5A to \$0F to shorten TAPET2 from $90 \times 5 = 450$ usec to $15 \times 5 = 75$ usec.

Since 255 + 450 = 705 used and 40 + 75 = 140 used, the baudrate is increased from 1418 to 8676. Since the data is sent byte-for-byte, rather than nibbled into two ASCII bytes/data byte, the "effective" baudrate is > 17 kHz. According to scope measurements, there appears to be around 1 1/2 bits of "idle" time between bytes. Rounding this up to 2 bits, we get a transfer rate of > 1700 bytes per second.

We could not work at a 100X rate, and did not try any rates between 60X and 100X.

SYM TO AND FROM KIM AND AIM 65

Since the SYM-1, KIM-1, and AIM-65 all have in common the KIM cassette format, interchange between these three over the cassette interface is possible, but takes 21 times as long as the standard SYM cassette dump. All three also support the "DEMON" paper tape format, which is not necessarily implemented at 110 baud over the TTY interface. It can also be used over the CRT interface at 4800 baud.

To try it between SYMs, ground the two SYMs together, and connect U38-pin 2 of the transmitter to U38-pin 5 of the receiver, with a switch in the line so that the receiver echo can be turned off when desired. Enter LP $\langle \text{cr} \rangle$ on the receiver and SP SA,EA $\langle \text{cr} \rangle$ on the transmitter. Close the switch, and enter $\langle \text{cr} \rangle$ on the transmitter. After the transmission is complete, open the switch, and enter ;00 at the receiver to exit the LP command. The switch is not required, but the echo from the receiver on the transmitter monitor may be confusing.

You should easily find the the corresponding connection points on the KIM and AIM systems. We understand that a number of 6800 based systems also support the "DEMON" format. Note that the AIM-65 uses the X OFF character, also known as (aka, or alias) DC3, CONT S, or ASCII \$13) to end the transmission. We were not able to check out the ideas presented here with either the KIM or the AIM, but see no real problems in this area. We'd like to hear from any of you who succeed or fail in this intercommunication task. Incidentally, DC1 (CONT Q), DC2 (CONT R), and DC4 (CONT T), are aka X ON, TAPE ON, and TAPE OFF, respectively.

Thanks to Steve Waldman, of Screen Sound Inc., of Burbank, CA, for many of the ideas in this section in particular, and many other ideas, in general. We spent a pleasant late evening together in his lab, working out many fascinating little problems.

SYM-PHYSIS 9:7

MORE ON RECORDERS

We purchased a Radio Shack Realistic CTR-80 Cassette Recorder (this is the recorder recommended for use with the TRS-80) nearly a year ago, but found it to be somewhat marginal in performance with the SYM-1. We found it necessary to approximately double the signal available at the Audio Out (LO) pin (A-M) by replacing the 470 ohm resistor at R88 with a 1 Kohm resistor. This improved the performance considerably, but a still better fix is described below!

We probably also should have brought out the Audio Out (HI) signal at pin A-P and tried it in the AUX input of the CTR-80, to have been completely thorough in our test. The AUX input might be better for recording. We will ask at Radio Shack which input is recommended for use with the TRS-80/CTR-80 combination.

Most small recorders, however, do not have an AUX input, which is a "high level" input, for cassette to cassette, or radio to cassette, transfers; thus, only the Audio Out (LO) should be used. Audio Out (HI) would require an external attenuator of some type.

We read somewhere that Radio Shack would upgrade the CTR-80 to the CTR-80A at NO CHARGE, to improve its performance as a computer I/O peripheral (with the TRS-80, of course!). Thus, when an internal mechanical part came "unglued", and we had to have it repaired we asked for the free upgrading. The repair invoice noted that a 10 uf capacitor and a "spike mod" had been installed. We don't know the details of the upgrading, but the "spike mod" is the essential item to improve performance. We now find the CTR 80"A" highly reliable, but the R88 modification may still be necessary.

A really nice feature of the CTR-80 is that the FAST-F and REWIND controls operate even when the remote control inhibits the PLAY and PLAY/RECORD actions. The Tape Counter is a useful feature for those who use longer than the C-10 (50 foot, 5 minutes per side) tapes we have been using, with only a multiple dump of very few files on one cassette. The CTR-80A is not listed in the Radio Shack Catalog, but is listed in the TRS-80 Computer Catalog as item 26-1206.

We recently purchased a Realistic Minisette-9 for a portable system we are building. It works very well (i.e., reliably) and is so elegant in its compactness. While it is relatively expensive, if you need or want the small size, the price differential is reasonable. The Minisette-9 is recommended by Radio Shack for use with the TRS-80 Pocket Computer.

One of our readers mentioned casually that his cassette recorder worked very reliably if it was not too near his video monitor. We had similar problems when using a SYM system on a card table with a metal rim. The metal "loop" antenna coupled the sweep frequency (approx 15.75 KHz) from the CRT yoke to the read head! The spikes showed up beautifully on a scope, together with the cassette signals we were monitoring, changing amplitude as we reoriented the monitor and/or recorder!

Although it probably does not directly affect cassette performance, it is interesting to note that we can actually "hear" the vertical scrolling of the terminal display through signals picked up by an unshielded cassette input lead, and passed through PB6 to our second DAC into a speaker. We must keep the volume control on DAC No. 2 turned down when not using the music system, partly for this reason, but mostly because otherwise we would be forced to listen to the busy buzz of tape loads. Some 60 Hz hum also enters the audio system through this route.

The moral here is that some cassette problems may be caused by the video monitor. This may be checked out by seeing if reliability is enhanced by turning off the monitor.

SYM-PHYSIS 9:8

KTM-2 MODIFICATIONS (AND RELATED TOPICS)

We have been using Jack Gieryic's JBP-4 KTM-2 Character Generator EPROM Burner program to replace the Character Generator 2316B ROMs in our own KTM-2 and KTM-2/80s with 2716 EPROMs. We particularly like the way the program makes full use of the KTM's cursor control capabilities, letting us use U, D, L, R, to "draw" the desired new character within an 8 by 8 rectangle indicated on the screen.

We never quite found the time to analyze either Jack's BASIC programs or the original ROMs to find out how the character generation is done by the KTM-2s. The following set of three short, but very elegant, notes by Dr. Gerhard Strube, not only describes the organization of the character generator ROMs, but describes in some detail the organization of the control ROM (in particular, for the KTM-2/80, but the KTM-2 ROM is essentially similar), and how to modify the keyboard encoding.

Two such mods we would like in our own KTM keyboard encoder are:

- 1) Interchange BREAK and TAB; why must we shift for BREAK?
- 2) Let SHIFT/SPACEBAR also enter a space; who needs the "pi"?

Synertek's 2316B is equivalent to Intel's 2316E. Both have three chip select pins, numbers 20, 18, and 21. The same numbered pins in the 2716 EPROM are OE (low), CE (low), and Vpp (high). The low and high in parentheses refer to the conditions for READ. There are eight possible configurations for the set of three thip selection pins on the 2316E/B, only one of which is compatible with that of the 2716. The control ROM of the KTM-2, (and incidentally, the Apple II ROMs) are, for some devious (?!) reason, not 2716-compatible, but this presents no obstacle to the determined researcher! A voltmeter or logic probe, on the hardware side, and a disassembler, on the software side, will reveal all secrets, and EPROMs are easily substituted.

The Epson MX-80 is delivered with its operating system and character generator in a single 4K ROM (NEC's D2332C); the microprocessor is a NEC 8049. Undoubtedly, users having access to an 8049 development system will disassemble the contents of the ROM and modify the character set to match their own personal requirements. The Graftrax 80, a set of three replacement 2716s, is sold only under the sub-license agreement that the contents are trade secrets of Epson, and that the purchaser "will not create or attempt to create, by reverse engineering, modification or otherwise, the source programs or any part thereof from the Graftrax 80 object program." Thus only the original 2332C ROM may be analyzed, and modified, and EPROMed, as Dr. Strube has done for the KTM-2/80, to meet one's needs. It certainly might be desirable to provide identical character sets, including the graphics symbols, in both the terminal and the printer.

And now, here are the three notes, photocopied from his original manuscript. Note that his manuscript is right-justified, printed on a shaped-character printer, with all of the DIN standard characters. We wonder what printer he uses?

CUSTOMIZING THE KTM/2-80 Dr. Gerhard Strube, Sckellstr.5, D-8000 München 80, Germany

(I) Changing the character set

SYNERTEK's KTM/2-80 terminal board features a 1920 character display, 24 lines by 80 characters each. The characters - both ASCII and graphics - are represented by a 'pixel' of 8 SYM-PHYSIS 9:9

bytes (= 8 * 8 bits), each bit corresponding to a dot on the screen. Since a total of 256 different characters constitutes the KTM's character font, 256 * 8 bytes, i.e. 2 kbytes, are needed to store the pixel patterns. The KTM uses two identical 2 K-ROMs (type 2316-8) which are switched to give the high speed necessary for a CRT display.

How are the pixel patterns coded? Page 0 of the ROMs comprises the top line of all the 256 patterns, page 1 the next line, etc., page 7 the bottom line of each. Bit 7 corresponds to the leftmost dot, bit 0, accordingly, to the rightmost one. Therefore, the pattern code for any character is to be found at a fixed lo-byte address (determined by the ASCII code), while the hi-byte of its address varies from 0 to 7. The lo-byte address is exactly the ASCII code of the character (0 to \$7F ASCII, \$80 to \$FF graphics), read back wards! Graphic characters fill the 8-by-8 matrix completely, while ASCII characters leave the left and right margins empty and usually the bottom row, too.

Suppose you want to change the appearance of the tilde (\$ 7E) to `B` (Greek beta, or German `sharp` s). You first invert the ASCII code, reading it from right to left, which gives (in that special case, only, the same code!) \$ 7E. This is the lo-byte address. Next, you look up the codes for all pixel rows, top row first, at addresses \$07E, \$17E, ... \$77E:

00 00 00 32 40 00 00 00.

Rows 4 and 5 are non-empty, resulting in the following pattern:

row 4: ..XX..X.

row 5: .X..XX.. See the wave-form?

Let us now devise the 'B':

row 1: ..XXX... = \$ 38 at address \$ 07E.

row 2: .X...X.. = \$ 44 at address \$ 17E.

row 3: .X.XX... = \$ 58 at address \$ 27E.

row 4: .X...X.. = \$ 44 at address \$ 37E.

row 5: .X....X. = \$ 42 at address \$ 47E.

rbw 6: .XX..X.. = \$ 64 at address \$ 57E.

row 7: .X.XX... = \$ 58 at address \$ 67E. row 8: .X..... = \$ 40 at address \$ 77E.

These values have to be stored to obtain a beta instead of a tilde for a \$ 7E. Since the KTM character ROMS are pin-compatible with standard 2716 EPROMs, any user with access to an EPROM programming device can alter the screen appearance of all the KTM characters.

(II) Changing the keyboard encoder

Another 2316-B ROM (Synertek § 02-0050A) contains program codes and the keyboard encoding table. Caution: pins 20 and 21 (unlike 2716's) are positive chip-select; you need have them at high level in order to read the ROM. Exchanging the ROM for a 2716 EPROM requires to change the jumper settings at J 18 and J 19.

The KTM uses two input lines to check the status of the SHIFT and CONTROL keys, and an 8-by-8 matrix for checking the other keys. This lay-out requires 2 * 64 = 128 bytes of storage for decoding the keys in lower-case and upper-case mode. Not all of the 64 cross-points of the matrix are used (the KTM has 51 keys apart from SHIFT and CTRL). These crosspoints are decoded by a null code. The KTM control functions ALPHA and BREAK are identified by a dedicated bit (bit 7 = 1, = 0 for all other characters). Bits 6 to 0 contain the ASCII code in reversed order! For instance, the key '8' (ASCII \$ 38) thus encodes to \$ 0E.

The keyboard encoding table starts from address \$ 723 up to \$ 7A2. Standard KTM lay-out is (only lower-case is shown):

U2 (5522)	PA	0	1	2	3	4	5	6	. 7	ROM addr.
U2 (6522)) PB	0	/	8	7	6	5	4	3	2	1	\$ 723-72A
н	PB	1	/			TAB		-	\$7E	0	9	\$ 72B-732
н	PB	2	/	u	y	t	r	e	W	q	ESC	\$ 733-73A
н	PB	3	/			RET		\$7D	р	0	i	\$ 738-742
н	PB	4	/	j	h	g	f	d	s	a		\$ 743-74A
н	PB	5	/		Al	PHA	DEL	\$7B	\$7C	1	k	\$ 74B-752
i	PB	6	/	m	n	b	v	С	x	Z		\$ 753-75A
U1 (6522)	PB	5	/			!	SPACE		/	•	, SYM-P	\$ 758-762 HYSIS 9111

note: some characters I use for control (e.g., \$5F) are replaced in the table with their respective ASCII hex codes.

The information given should suffice to change the keyboard according to any desired lay-out. (E.g., my KTM now meets German standard DIN 2137 with $\ddot{A},\ddot{0},\ddot{U},~\ddot{a},\ddot{o},\ddot{u},~and~B$ at their proper position.)

(III) Attaching a numeric keyboard

Provided you do a little soldering, you may attach any kind of extra keyboard to the KTM by hooking it onto the keyboard matrix lines shown above. You are free to either parallel an existing KTM key with a new one (e.g., the cipher keys 0 to 9), or else use the hitherto free cross-points. I combined both these approaches when attaching a pocket calculator keyboard to ease the tedious keying-in numbers when inputting to SYM-Basic. The design uses the 8 PA-lines as well as PB 0 and 1, and §1 PB 5. Parallel keys are used for 0 to 9, for - and ., while unused cross-points now decode E (for entering floating-point numbers in scientific format), \$ 5F (the SYM Basic cancel character), and Return on U1 / PB 5. (The keyboard cost half an hour of work and \$ 2.- for a surplus calculator case.)

Let me conclude by expressing the hope that these suggestions will provide KTM users with a terminal both cheap and unbeatably versatile.

A RAE CROSS-REFERENCE LISTER

Kin-ping Kwok sent us three RAE-1 enhancements for review, with permission to publish two of them freely, and asking for comments on the third. The first two programs provide alphabetic and numeric sorts of the RAE-1 label file after assembly. While we ourselves have little need for the numeric sort, we publish it here for a specific reason, to be revealed below. Kwok's alphabetic sort is much faster, in general, than the earlier published alphabetic sort by Cyr, but the Cyr sort is faster if the labels are in close to the proper order.

We compared Cyr vs. Kwok on an extremely long label file. We used the label file for Brown's new Extended Disk Basic; we don't know how many labels it has, but it is some \$1568 bytes long! Kwok's numerical sort was used first, to ensure a common starting sequence for the two alphabetic sorts. We also wanted to be able to "break up" any starting alphabetization to some extent; otherwise the "bubble sort" would have an unfair advantage. Kwok is considerably faster, but when applied twice in a row, both trials take the same length of time; the second pass of Cyr is nearly instantaneous, because of the already established sequence.

SYM-PHYSIS 9:12

If you look at the label files following the assembly listings below, you will see why Mr. Kwok's third program really thrilled us. We must admit that RAE's normal label file looks pretty sloppy. Kwok's alphabetized cross-referenced label file adds a real touch of class to a RAE listing, and it will really be helpful in analyzing a DISARAEd listing. Note that macro names and labels (those with !!! and ... prefixes) do not appear in the listings, and that the macro "dummy" variables' "defining" line numbers do not include the # prefix (e. g., ADDRS, FROM, TO).

Mr. Kwok's preliminary version was somewhat awkward to use; it required a preliminary alphabetic sort, and some fancy manipulations if the source file was segmented, i. e., if it required one or more .CTs. The "final" version includes the initial sort, and has simplified the .CT problems. We have not fully tested the .CT workings on large source programs. To speed up the testing we will first modify the program to permit .CT (Disk Filename). One problem we forsee is the possible necessity of dumping partial label files to disk or cassette, with .CTs themselves, since the Cross-Reference files replace the source code files as they are generated; and running out of space is a real possibility.

As soon as this issue goes to press we will give this program highest priority, because of its obvious utility value. We will distribute a combined cassette/disk version using conditionals to permit user selection at assembly time. See shopping list for details. Now here are the two sort programs, with cross referenced label files:

How do you like the CROSS-REFERENCED Label Files?

Note that the listings above do not include the macro expansions, because of the paper waste in listings with .ES. We also did not provide has dumps, which would, of course, have included the bytes missing from the source code listings, because every user of these programs must have RAE-1 to use them, and every user of RAE-1 will key in the source codes rather than the object codes, anyway.

Incidentally, the sorting algorithm used by Mr. Kwok in these two pro-

grams is known as the "insertion" sort. We have heard of it, certainly, but have never used it before this. It is definitely faster than the usual "bubble"—sort, unless the data to be sorted has (have?) only a very few out—of—place items.

NUMBERING RAE FILES

The use of the RAE NUmber command is not well covered in the Reference Manual. The following example shows how to set both the starting number and interval easily. Suppose you have a source code consisting of several sections, each ending with a .CT, except the last, and you wish the numbers to continue in sequence from one section to the next. This is particularly important in using CROSS REFERENCE, where a single Cross Reference Listing is prepared to cover all sections.

Assume that the starting number of the first section is 8985, the interval is 5, and the ending number is 1755. You would like the second section to begin with 1768, with interval 5, etc. Use the NU command twice, as follows: NU θ 1755 <cr>, NU 1755 5 <cr>. Disregard any error message (!18, indicating line number overflow) after the first use of NU. The second section is then numbered as specified.

A NEAT RAE TRICK

The following letter from James Duckworth presents a very neat idea we wish we had thought of.... Our excuse for not having thought of it first is that we call all of our supporting programs, such as SWP, PON (printer on), etc., from RAE with the DC command, as "overlays" in the PODS utility program area. This means we have been wasting time waiting for the disk load. We shall be rewriting many of our RAE enhancement packages, including our new XREF, to use Jie's trick.

Jim did not send his letter on cassette, but rather on a thermal printout paper, and we reproduce it as a photocopy of a Xerox copy of his original letter. The printer, whose name we cannot recall at the moment, provides excellent hard copy by "burning" away a silvery appearing coating to reveal a black undercoating. We like the lower case descenders, and the paper Xeroxes reasonably well.

We seriously considered this printer, especially because of its low cost. We decided against it because our main "product" is the newsletter, and any "rough" handling of the printouts in the process of cutting and pasting the camera-ready copy would introduce black appearing scratch marks on the copy. If we had a plain paper copier this would have solved the problem, as we could then have cut and pasted copies. As of this writing, however, the Epson MX-86 is very little more expensive than the thermal printer, but far more versatile.

Dear Lux.

This is just a quick note to let other SWP-1 users in on a little trick I discovered, because I got tired of typing "RU \$3800", to invoke the SWP program. The first method, which works pretty well, is to put at \$0003 through \$0006 the code "4C 00 38", and then call SWP with a simple "US", followed by a carriage return. This method is a quite obvious use of RAE's USER command, which transfers control through a vector in ZERO page memory, to a users program.

A not so obvious way to call SWP is to create a dummy label, called "SWP" of course. It is done in the following way. After calling RAE, but at sometime before SWP is needed, type in the following;

1SWP .DE \$3800 cr

AS cr

After the error message, type in;

DE 1 cr

RAE has now forgotten all about line 1, but a label exists in the LABEL file named "SWP" with an address of \$3800. Now a call to RUN SWP does exactly that. The label and its address remain there in memory until over-written or the power is shut off. Now this is what I call a neat trick. It is so much easier to remember "SWP" than some hexadecimal address.

Jim Duckworth

MULTI-PURPOSE RAE PATCH

The following program was intended to be a very simple patch to RAE to permit only one added feature: increasing the length of the SYNCH interval for PUt, for the benefit of those readers who were having troubles reading their RAE files because of sluggish recorder time-constants. Since this involved using PUt, we decided to include the .CT patch, which involves GEt. The program began growing in an uncontrolled fashion when we began adding explanations of how ENter and LOad influence PUt and GEt. As long as we had gone this far, we added some additional features, taking care of ALL the vectors and jumps. We could have added even more, but decided to leave the rest to you.

```
9919 ;
          A MULTI-PURPOSE RAE-1 PATCH
6626 ;
                18-AUG-81/LUX
9939
8646 ; RAE-1 "ordinarily" uses only from $B6 thru $EA
8050 ; and $EE and $EF on page zero. $B6 is initialized to
9969; 68 (RTS), and $EE and $EF are initialized to $60.
9980 : If >HA S is given as a command, all output is vec-
$696 : tored through $86. Thus $86 can be used to vector
9199 ; to your printer patch, if desired. >HA C disables
$115; the vectoring.
Ø12Ø
0130; GEt and PUt examine the "flags" at $EE and $EF; if
8148; these are zero the "normal" cassette I/O is sup-
$15$ : ported. If these flags are non-zero, GEt and PUt are
$168; vectored through $F6/$F7 and $F4/$F5 respectively.
Ø17Ø
0180; Three "undocumented" commands, >LO (for LDad, or LOok-
6196 ; up), >EN (for ENter), and >DC (for Disk Command) are
9299 : available for linking to disk operating systems (DOS),
9210; e.g., FODS or CODOS. When not required for disk 1/0
0220 : these commands may be used for other purposes, as
0230 : shown by the following example.
Ø24Ø
0250 ; Not shown in the example, however is the method by
9260; which these (and all RAE commands, for that matter)
0270 : pass their parameters. At entry to the vectors the
0280 ; Y register contains the hex value of the position
0290; within RAE's CRT Buffer of the first non-space
0300; character following the command, e.g., ENTER.
0320; If Y=$50, no parameters were passed. Otherwise the
9339 ; parameters may be "picked-up" and interpreted be-
6346 : gining at $6135, Y. Hence, for example, you may
0350; add as many "new" commands as you wish to RAE by
0360; calling >DC PRINTERON, >DC PRINTEROFF, >DC SWP.
0370; >DC SORT, >DC CROSSREF, etc.
                                                SYM-PHYSIS 9:19
```

AN IMPROVED PRINTER PATCH

We moved our MX-80 printer from the B port to the A port to free PB6 and PB7 for counter/timer applications. We also modified our method of setting PCR to do so without affecting CB1 and CB2 when activating the printer patch, so that these lines could be used for other purposes.

NOTE THAT THE A AND B PORTS HANDLE HANDSHAKING DIFFERENTLY; FAILURE TO ALLOW FOR THIS WILL CAUSE SYSTEM HANGUP! CB2 pulses low only after a write operation to PBD, while CA2 pulses low after either a write to or a read from PAD. The BIT test for BUSY must therefore be made at the no-handshake PAD register at \$XXØF.

The original patch was designed to work with RAE-1, and would not handle the "up-arrow" of BAS-1 properly. The byte at \$C1 is a "JMP" in BAS-1, and the high byte of the start address of the relocating buffer for RAE-1. By checking this memory location when the "up-arrow" occurs, the correct handling for BAS-1 is provided. Here are all required program changes for the "improved" parallel patch:

STILL MORE ON PRINTERS

As you can see above, we have learned to underline from RAE and SWP on the Epson! And installed a "software switch" to turn the printer off and on, as well. In addition, we now can also use the horizontal tab features of the Epson.

As you know, RAE handles CTRL H, I, and $\, Q \,$ in peculiar ways. Unfortunately, these peculiar ways conflict with the Epson way of doing things. Epson uses CTRL $\, Q \,$ to enable the printer (and CTRL $\, S \,$ to dis-

SYM-PHYSIS 9:23

able it), CTRL I for tab control (in a manner inconsistent with RAE) and CTRL H in a manner which, in effect, allows backspacing without erasure, thereby permitting underlining, and, if desired, overstriking).

Fortunately both RAE and the Epson treat the DELETE (\$7F) in essentially the same way (except that RAE does echo a "\". As will be seen below, this feature makes for "clean" soft (on the CRT) copy.

The trick is to have RAE echo and output CTRL U, V, and W (or any other unused control characters) as if they were CTRL H, I, and Q. The first line of the listing from which this text was formatted prints on the terminal as ^Q, although CTRL W was actually keyed in and stored in RAE. This turns on the printer. The second line contains the SWP instruction .L, to indicate a fresh line start. The third line contains the data "STILL MORE ON PRINTERS" followed by 22 "^H"s followed by the correct sequence of underlines and spaces ______ The ^H's were entered as CTRL U's. The last line of the listing contains a "^S", entered as CTRL S.

To turn the printer on and off from RAE's command mode, enter CTRL W or CTRL S, followed by a DELETE (\$7F, RAE echoes "\"). The DELETE prevents an error message from cluttering up the screen.

Here is the section of the printer patch which does the job:

1979	JSR TOUT	

Note that to permit "Printer Select" from the host computer, DIP Switch 8 must be set to the "Select Not Fixed" position, and the printer then powers—on as "non-READY". You may wish to include a LDA #\$11, and a JSR OUTCHR in the Initialization Routine to make READY the "default" condition. \$11 is the ASCII code for CTRL Q (DC1). An external hardware on—off switch can also be provided. Grounding pin 36 on the Amphenol connector will turn the printer on, i.e., "select" it. The hardware and "software" switches are wire—"or"ed together (active low). Dip Switch 8 essentially grounds pin 36; CTRL Q sets a flip-flop which does the same thing; CTRL S resets the flip-flop.

SYM-FHYSIS 9:24

ON WORD PROCESSORS

Most of our work involves the use of RAE rather than BASIC, hence we find it convenient to use SWP (a very highly customized version) as our word processor. Actually we use RAE as the Text Editor, and SWP only as the Formatter.

Many of our readers prefer BASIC to RAE, and do not even have RAE installed. For them we are distributing KWOK'S BASIC WORD PROCESSOR (BWP-1). We have tried, and liked BWP-1, but have not yet built up any real skill in its use.

We have tried TECO, a very popular Text Editor developed by DEC for their PDP- systems, and very graciously placed in the public domain by them. Many months ago Frank Winter sent us a Formatter Supplement to the TEC65 (editor) program package distributed by the 6502 Program Exchange. Shortly thereafter. Dale Holt sent us a complete package for review, but the source code was not in RAE format. Dick Albers worked with Dale, converting source code to RAE format, and helping to debug and enhance Dale's original version.

The Holt/Albers version of SYM-TECO should be ready for distribution early next year. It is stand-alone, requiring neither BAS-1 or RAE-1 (although the latter would be very helpful in customizing it).

Aside from the obvious cost savings, the major advantage of TECO lies in its "universality", in that many time-share users learn TECO as their first word processor, and TECO-type word processors are available for most systems.

Denny Hall, who uses his Apple II for most applications, feels that the SYM-1 is a better way to go for word processing, and that the cost of a SYM-based word processor to supplement his APPLE is much less than the cost of the added "cards" necessary to convert the Apple to a word processor. Also, he has found, as we have, that two individual systems can, at times, be more useful than one dual-purpose system, since they can be used simultaneously on different tasks.

(Parenthetically speaking, one of our "one-of-these-days" ambitions is to develop an interface card (and the software!) to join the Apple and the SYM. A single SYM would, at much fower cost, replace many RS-232, Serial/Parallel I/O, Printer Interface, 80 Character/Lower Case, etc., add-on cards for the Apple. What a market for this!)

At any rate, Denny is putting the "finishing" touches (we are sure he will continue to provide continuing customer support) to a SYM-based Word Processor, with special control features, for a student with limited use of his hands. Denny plans to OEM SYM-based word processors, standard or customized with, for example, large character sizes on the CRT, verbal feedback, elimination of the need to strike two keys simultaneously as for CTRL characters, etc. He had planned to use RAE/SWP, and is doing so for his first systems, but is seriously considering SYM/TECO in EPROM instead. The student for whom he is building the first system will also be using the system as a terminal (from home) to the school's PDP-11, on which TECO is also available, and the compatibility will be a strong plus! Incidentally, we both consider the Novation D-CAT Modem (the "D" is for Direct Connection) to be the "best-buy" for computer networking.

MORE ON BUFFERING

We have mentioned that "over"-buffering of the SYM's Address and Data Busses can cause the kinds of problems buffering is supposed to solve. The following extract from a recent letter presents additional experience with "overkill" in buffering:

Another point, and this is really the last one. You remember

Lux that I wrote you about my memory problems some time ago when I bought FORTH. [Yes I certainly do remember, Marc. how discouraged and frustrated you were over the memory problems you were having at that time! - Lux]

Here is my mistake; perhaps it can help others: I decoded the addresses for the RAMs with 2 74LS138s. The first for the 8K blocks, the other for the IK blocks. Also on each card I buffered Address as well as Data lines even when they were already buffered on my mother-board. I eliminated the buffers on each card and replaced the 74LS138 with 74S138 and now everything works fine.

Yours SYMcerely.

Marc SYMons Woudlaan, 50 B-1970 Wezembeek-Oppen

A RAE CLOCK/TIMER

Here is a truly powerful utility for RAE-1! It provides the time and date information on request, and even inserts the information into your RAE file at Line 0000, so that you can mark a file with the latest revision date and time.

Here are a few precautions on its use: It will not interfere with Cassette I/O at the normal 1400 baud rate, nor with serial terminal I/O at less than 1200 baud. It also will not interfere with Disk I/O, since the DOS checks all reads and writes against check sums until it is satisfied that all has gone well (it will, of course, give up, and let you know about it, after a prespecified number of failures). The interrupt service time is short enough to cause no problems, except possibly at midnight, especially at the end of the month, and New Year's Eve, when you probably are not at the computer (at least leave the terminal for a few seconds).

Operation of the terminal at 4800 baud, however, could cause problems. If interrupt occurs during a character output time the character on the terminal will be garbled. This is not too serious. An interrupt during a character input time could be disasterous. What if the character was garbled into a CTRL B, which sends the SYM into BASIC, and destroys pages Ø and 1?????????? Dick Albers guards against this kind of near catastrophe by calling an input program which calls SEI during character input time (this feature should have been in SUPERMON!) to inhibit interrupts.

We would like to see the matter handled by having a keystroke also create an IRQ (or maybe an NMI) as in the Moser Paddle Game in an early issue, and giving keystrokes priority over timer interrupts. It would be fun to work out the details; meanwhile we will keep the clock running whenever we are in RAE, to get some idea of the frequency of catastrophes! We are putting our faith in being able to recover any "lost" RAE files by the

It just happened!!! Hit the <cr> and an up-arrow N appeared. Hit another key and the program went into limbo......

As we were saying, we can recover "lost" files by the method described in the RAE-1 REFERENCE DATA CARD sent out with RAE NOTES #1. on how to recover after "accidental" CLear. If the problem occurs too frequently, we shall write the priority interrupt handling program. Incidentally, the use of an interrupt driven clock is one more justification for using a parallel interfaced printer rather than a serial driven one; clock interrupts can't botch up the hard copy. And now, here's the program: (15:05:46 SUN 1 NOV 1981)

EDITOR'S NOTE:		

WE PUBLISH THIS OVER DICK ALBER'S PROTESTS THAT IT IS NOT YET READY FOR PUBLICATION! HE DID APPROVE PUBLICATION IF WE CLEARLY MARKED IT AS A "PRELIMINARY DRAFT", AND DID POINT OUT THE THREE PROBLEM AREAS, FOR ALL OF WHICH HE HAS SOLUTIONS. HE HAS PROVIDED THESE SOLUTIONS, WHICH, AFTER DEBUGGING AND "POLISHING", WE SHALL PUBLISH IN THE NEXT ISSUE OF SYMPHYSIS.

THE FIRST TWO PROBLEM AREAS, AS MENTIONED IN THE INTRODUCTORY TEXT, REQUIRE POINTING INVEC AND OUTVEC TO SUBROUTINES WHICH INHIBIT INTERRUPTS DURING THE ACTUAL I/O OF THE SERIAL BITS.

THE THIRD PROBLEM AREA IS DUE TO THE OFTEN OVERLOOKED FACT THAT THE BREAK INSTRUCTION SETS THE I FLAG AS WELL AS THE B FLAG! THUS, ANY EXITS TO MON FROM RAE (DONE VIA THE BRK INSTRUCTION) STOP THE CLOCK. THE SOLUTION TO THIS IS TO POINT UBRKVEC TO A ROUTINE WHICH INCLUDES THE NECESSARY CLI INSTRUCTION.

A BASIC TIMER

Now you will see why we moved our printer to free up the B port for more valuable uses. The following BASIC program, by Joe Hobart. provides a very informative demonstration of the use of the Timer/Counter in the VIA. We have modified Joe's original program to use Jack Gieryic's BASIC 'GET' Function, which should be of much interest to BASIC users.

AN INTERVAL TIMER FOR SYM BASIC

BY JOE HOBART, 3465 ANDES DRIVE, FLAGSTAFF, AZ 86001

PROGRAMS LIKE "OREGON TRAIL" USE A TIMER TO MEASURE THE INTERVAL BETWEEN THESE PROGRAMS' STIMULUS AND A PERSON'S RESPONSE TO THAT STIMULUS. THE 6522 LOCATED AT U-28 PROVIDES A SIMPLE WAY TO IMPLEMENT SUCH A TIMER. THE FOLLOWING PROGRAM ILLUSTRATES THE USE OF THE 6522 AS A VERY ACCURATE TIMER THAT CAN BE USED IN A BASIC PROGRAM TO GIVE INTERVAL MEASUREMENTS FROM Ø TO 600.00 SECONDS. THE ADDRESSES SPECIFIED REQUIRE THAT U-28 HAS BEEN INSTALLED AND THAT PB7 (AA-6) BE CONNECTED TO PB6 (AA-H). I USED AN EDGE CONNECTOR WITH PIN 6 WIRED TO PIN H SO THAT IT COULD BE EASILY REMOVED TO USE OTHER ACCESSORIES AT THE AA PORT.

THE PROGRAM CAN BE MODIFIED TO GIVE OTHER RANGES BY CHANGING THE NUMBER STORED IN T1 REGISTERS. 5000 GIVES A .01 SECOND WAVEFORM AT PB7. 50000 WILL GIVE A 0.1 SECOND WAVEFORM AND A TIMER THAT WILL COUNT BY TENTHS TO SIX THOUSAND SECONDS. THE DIVISOR IN LINE 320 WILL HAVE TO BE CHANGED TO 10 TO GIVE THE CORRECT TIME, HOWEVER. NOTE THAT READING THE T2 REGISTERS DOES NOT STOP THE COUNT DOWN. THE DNLY WAY TO RESET THE TIME IS TO RELOAD THE T2 REGISTERS BY POKE STATEMENTS. ONCE STARTED, THE TIMER T1 WILL PROVIDE A STEADY OUTPUT WITHOUT FURTHER ATTENTION. T2 WILL THEN DECREMENT ONCE FOR EACH PULSE FROM T1. IF LEFT UNATTENDED, T2 WILL PASS ZERO AND CONTINUE COUNTING DOWN FROM 65536.

ONCE ALL THE REMARK STATEMENTS HAVE BEEN REMOVED, THE PROGRAM IS QUITE SHORT. TI ONLY HAS TO BE INITIALIZED ONCE. TO CAN BE LOADED OR READ AS DESIRED DURING THE PROGRAM. THE TIMER IS COMPLETELY INDEPENDENT OF ANY OTHER PROCESSING ON THE SYM.

(Added notes by Lux — We have hade up a number of patch cords with microclips on both ends, and used such a cord to jumper AA-6 to AA-H on the 44 pin connector wired to the Epson. We used the square wave generated at PB-7 to check out the time base calibration of our scope. We have ordered a really nice frequency meter made by Albia, and we look forward to its arrival so that we can use this program to generate test signals for it.)

```
arrival so that we can use this program to generate test signals for it.)

```

300 PRINT"The timer is running.....":PRINT 310 GOSUB1000 320 T=INT (60000-PEFK (43016) -2564PFFK (43017)) /100 330 PRINT:PRINT"Elapsed time was "T"seconds." 331 PRINT 346 GOTO166 1000 POKE42579.0:GOSUB1001:POKE42579,128:RETURN 1001 Q=USR(-30120,-11957.0);CH=128-(Q/(-256)) 1002 IF CH=27 THEN POKE 42579,128:END 1003 RETURN 1004 REM Lines 1000 - 1003 are based on a very ingenious BASIC "GET" 1005 REM program submitted by Jack Gieryic many months ago but not yet 1006 REM published due to lack of space. We present it here for your use 1007 REM without explanation of how it works, except to say that line 1008 REM 1000 controls (i.e., suppresses echo of the "GOTTEN" character 1009 REM and may be omitted if desired) TECHO.

Hit any key to start timer, then any key to stop it. The time interval between keystrokes will be printed. Exit with ESC key.

The timer is running.....

Elapsed time was 2.71 seconds.

Hit any key to start timer, then any key to stop it. The time interval between keystrokes will be printed. Exit with ESC key.

OK:

ON PRINTER RIBBONS

One very minor problem we have found with the Epson is a relatively short ribbon life. By this we do not mean that the ribbon becomes unuseable, but that the impression seems to "weaken" very rapidly: The ribbon is not rolled tightly on a spool where it has a chance to "re-ink" itself from contact with adjacent layers. Instead it is literally pushed into one end of an enclosure and pulled out at the other end.

For most applications the gradual lightening of the impression would present no real problem; just discard the ribbon whenever the printing appears too light for your taste. This does present a serious problem in preparing camera-ready copy for publication, however, in that material printed several days apart cannot easily be matched in appearance. Pasting in a corrected word or phrase in the middle of a previously printed paragraph looks bad if the new material appears much lighter or darker. We find that we must reprint the material again, with the corrections made in the computer.

We tried to "revive" a ribbon by giving it a half-twist, and rewinding by hand to use the other edge. This made no difference. A friend passed on to us the following tip he had heard from an Epson user: Pry open the top cover of the ribbon cartridge and saturate the ribbon with WD-40 spray lubricant (a non-silicone containing product made in San Diego, CA; don't know if it is available on a national basis). Give the material an hour or two to penetrate and/or evaporate; wipe off the cartridge, and replace it in the printer. The ribbon will then have a new lease on life:

Our friend did not know how many re-leases were possible. We tried it, mostly out of curiosity, and it does seem to work. With new ribbons selling at around \$15.00, this could be a real money saver! We now feel challenged to see just how many WD-40 recycles a ribbon can accept in its lifetime!

"STRUCTURED" ASSEMBLY PROGRAMMING IN RAE!

Norbert Thuering, address below, sent us a review copy of his MAC65 (why do we keep thinking of it as "Big MAC"?) enhancements to RAE-1. He used RAE'S built-in conditional and macro capabilities to incorporate a very powerful set of new pseudo opcodes into its structure, using the prefix "a" as the designator. These new pseudo-ops provide the experienced RAE user with a fully structured programming tool.

The easiest way to explain both MAC65 and the entire concept of "structured" programming is to reproduce below the simple, but elegant, two page instruction manual, which includes an informative comparision-by-example with Pascal, and portions of a sample run in which the "proprietary" macro definitions were "blanked" with the .LC (List Clear) pseudo optode. We will be distributing MAC65 for Mr. Thuering (details elsewhere).

When you wish to use MAC65, enter RAE at its cold start (\$8000) and modify the default set parameters to meet your needs. Next get MAC65 from mass storage, and then begin entering your program at the end of MAC65 (just after LS). Then ASsemble your program and check 9SP and 9NEST in the label file to be 0000 (no nesting errors). Now the program is ready for use.

Syntax of MAC65:

```
Here is a short macro-syntax description:
  all macro key-words begin with '9'

I optional, may be omitted
block may be repeated
                syntactic constructs
<block> ::=
                { <expr> (cond> (expr> )
  ( <expr> (cond> (expr> ))
  ( <expr> (cond> (expr> ))
 ...EJÄND
 ...[30R
      THEN
       <block>
     COELSE
     (<block>)
      DWHILE ( <expr > <cond > <expr > )
DAND ( <expr > <cond > <expr > )
DOR ( <expr > <cond > <expr > )

 ...[JAND
       <block>
      DENDWHI
      DEUB
               ( <var> <start> <end> <step> )
      <block>
      anext
      QCASE
              ( <var> )
      JOF.
                ( <expr> )
                ( <expr> )
      <block>
     £ 90F
               ( <var> )]
                ( <var> )]
 ...[⟨block⟩
@ELSE
    [{block>]
     QWRITE ( <label> )
                                     Text must be declared as follows: TEXT1 .BY 'This is a text' Ø .
```

--> IMPORTANT! Variables used in the program have to be declared before use, otherwise the macros of MAC65 won't work correctly (refer to example of HI-LO game).

The macros are intended for use with variables and constants restricted to the range of 0, . . . ,255, or, \$00, . . . ,\$FF.

Do not use variables located at page zero.

SYM-PHYSIS 9:37

EXAMPLE: HI-LO GAME

```
The following example is divided in two parts: on the right is a PASCAL-like notation of the example program, on the left the equivalent MAC65 notation.

NOTES:

- The hex code may be entered from MON, but the game MUST be played from RAE by calling RUN \$023A. The clocks, all of them, behave "strangely" when called from MON as this program uses them!
- The random number is in HEX, so enter two hex digits.

RAM-BLINGS

Being fond of puns, we changed the name of this closing section of the newsletter from MISCELLANEA to RAM-BLINGS, since we randomly access our memory for items to fill the remaining space.

You will notice that parts of this issue are printed 8 lines to the inch, instead of the usual six. If there are no complaints, we will change over to the eight lines per inch, permitting 33 1/3 % more material in the same space. We'll stay with the pica size (10 pitch, or CPI), and 70% photoreduction and avoid the 16.5 CPI of which the Epson is capable.

SYM-FHYSIS 9:39

Jack Brown has asked us to announce, in a preliminary way, that he is nearly ready to formally announce the existence of his SYM-Pascal. Both cassette-based and disk-based (FODS) versions will be available. Detailed information on availability, specifications, and prices will appear in issue number three of his newsletter, Saturn Softnews.

We have seen the first two issues, which provide very strong support to users of his FORTH and BASIC enhancements. Those interested are urged to contact Jack, directly, for a subscription. Address: P. O. Box 397. New Westminster, B. C., V3L 477, Canada. Price \$10.00 (US) or \$12.00 (Canadian) plus \$4.00 (US) for overseas airmail.

It wasn't the teaching, traveling/lecturing, hardware and software developing, etc., that delayed this issue. It was a very, very, slowly moving kidney stone that lowered our energy level by over 50% for some six weeks, and reduced our work output. Now that we are no longer "stoned", you can expect Issue #10 to arrive within six weeks after this one, around the first of the year.

We had hoped to announce, with this issue, prices and availability for a number of new software products, but these will have to wait until Issue #10, which will include a completely updated Shopping List. The new packages include Kwok's Cross Reference Lister, Kwoks's BASIC Word Processor, Thuering's MAC65, Holt's TECO Word Processor, a Music Package for limited RAM systems, and several others.

We are OEMing customized SYM-based systems, and have been purchasing in quantity, to get good price breaks, such items as Epsons, Cassette Recorders, Power Supplies, Disk Drives, etc. Contact us about special prices for any peripherals for your SYM!

Jack Gieryic has developed the required CODOS/SYM-BASIC link, based on Jack Brown's Extended SYM-BASIC. The pair of Jacks are working out marketing and distribution agreements. This was the "missing link" as far as the Users' Group being able to provide software support to SYM/CODOS systems.

We now have two, soon three, SYM/FODS Dual-5" systems, and one SYM/CODOS Single-8" system. It is not easy to prepare software for distribution on a single drive disk system!!!! By year's end we will have upgraded our SYM/CODOS system to Dual-8", and installed a SYM/FODS Dual-8" as well. We will attempt to make SYM software available on any medium used by a significant number of users. By next summer, if all goes according to schedule, your modem can talk to ours!

We will be on sabbatical leave from California State University, Chico, from January through August, 1982. We plan to spend much of this time "researching" and writing, but will be making two 4-6 week trips, one to Australia, New Zealand, and the Orient, the second to Europe and the Middle East. The southwest Pacific trip will be during April/May, the European trip has not yet been scheduled. If you are associated with an overseas university or educational institution at any level, please write. We would like to visit, and perhaps arrange a guest lecture or seminar session, at no charge, except for local expenses.

Steve Perry, of Perry Peripherals, P.O. Box 924, Miller Place, NY 11764, asked us to mention that he is now set up to provide a quick turn-around time on SYM-1 repairs.

As usual, we had more material, and really quality material, submitted then could be published. Even if we had more space, there would not have been enough time to go over the material, anyway. We will not publish any software, or technical articles, unless we have thoroughly verified the validity (or is it validated the verity?). We are quite proud that there have been so few typos, and only one program bug (and we pointed out the existence of that bug when we published the program). Much of the submitted but as yet unpublished material will appear in a special volume next simmer: so keen the material comind! special volume next summer; so keep the material coming

We thank those of our readers who are helping us to review submitted material, especially Dick Albers, who has also provided us with a 6809 Tiny BASIC for the SYM-69. His version was based on an article in a recent issue of Dr. Dobbs' Journal.

Issue #10 will feature BASIC (as this issue featured RAE). We will also review, based on hands-on testing, the SYM-2 and the recently announced Synertek Disk Controller Card.

Jean - Lup
